How to make it stick

1. **Story chain.** Learn the talk as one story (above), not as 16 separate slides. If you know where you are in the story, you know what comes next.
2. **3 words per slide.** Each slide = 3 keywords. Look at the slide title, say the 3 words in your head, then speak. That is all you need on stage.
3. **Number hooks.** Every number has a picture or a trick (282 is a palindrome, 9.3 vs 3.9 are mirror digits). Hooks are on your memory page.
4. **Shadowing.** Play your shadowing track: after each phrase there is a pause of the same length. Repeat the phrase aloud in the pause.
5. **Self-test.** Cover the right column of the self-test and answer aloud. Retrieval, not re-reading, is what makes memory stick.

RUN OF SHOW

At a calm 125 words per minute plus a pause on each click. The audio is a little faster (≈ 140 wpm), so live you will be ≈ 10 – 20 s longer than your audio.

01 Malaria 0:00 – 0:22 · click → slide 1

Good afternoon, dear teacher and dear audience. Today our group will present one of the oldest and deadliest diseases in human history: malaria. Before we start, let us introduce ourselves. My name is Azamov Javohir Latipovich, and my ID number is b2600910.

---

02 Outline 0:45 – 1:08 · click → slide 2

Thank you. First, I will explain what malaria is and how deadly it is. Then Muhammadrizo will talk about its history and the biggest outbreaks, Ramazan about the numbers today, and Akmalbek about how we fight back: vaccines, prevention and treatment. Finally, I will conclude.

---

03 What is malaria? 1:08 – 2:00 · click → slide 3

So, what is malaria? According to the World Health Organization, it is a life-threatening disease spread to humans by mosquitoes. Our task asks if it is viral or bacterial. The answer is: neither. Malaria is caused by a parasite, a tiny single-celled organism called Plasmodium.

The parasite travels inside the female Anopheles mosquito, which bites mostly at night. After the bite, the parasites hide in the liver, and then they attack the red blood cells. Malaria does not spread from person to person.

Five species of Plasmodium infect humans. The most dangerous are vivax, the most common outside Africa, and falciparum, the deadliest one.

---

04 How deadly is it? 2:00 – 2:48 · click → slide 4

And how deadly is it? The first symptoms usually start **ten** to **fifteen** days after the bite: fever, chills and headache. It looks like the flu, and that is exactly the danger. Left untreated, falciparum malaria can progress to severe illness and death within **twenty-four** hours.

When severe malaria is not treated, the death rate approaches **one hundred percent**. Even with good hospital treatment, **ten** to **twenty percent** of these patients still die. So the key word is time: fast diagnosis saves lives.

But how long has this parasite been with us? Muhammadrizo will tell you.

---

14 Conclusion 12:24 – 13:14 · click → slide 14

Thank you, Akmalbek. To conclude, here are our four main ideas.

First, malaria is caused by a parasite, and without treatment it can kill within one day.

Second, it has been with humanity for almost **five thousand** years.

Third, it is still a huge problem: **two hundred and eighty-two million** cases and **six hundred and ten thousand** deaths in **2024**, mostly young children in Africa.

And fourth, we know how to win: vaccines, bed nets and fast treatment. Uzbekistan is the proof.

So our message is simple: malaria is preventable and curable. Block the bite, test early, treat fast.

---

15 Thank you 13:14 – 13:22 · click → slide 15

Thank you for your attention. We will be happy to answer your questions.

YOUR MEMORY PAGE

✂ cut out · the only notes you take on stage

01	Greeting → topic: oldest + deadliest disease → "let us introduce ourselves" → full name + ID
02	Me: what + how deadly → Muhammadrizo: history + outbreaks → Ramazan: numbers today → Akmalbek: vaccines, prevention, treatment → me: conclusion
03	WHO definition · NOT virus, NOT bacteria → parasite Plasmodium · female Anopheles, night · liver → red blood cells · not person to person · 5 species: vivax (outside Africa), falciparum (deadliest)
04	10–15 days · fever, chills, headache = looks like flu · 24 hours · severe untreated ≈ 100% · treated 10–20% · key word: TIME → pass to Muhammadrizo
14	Thank you, Akmalbek · 4 ideas: 1 parasite, kills in 1 day · 2 ~5,000 years · 3 282 M / 610k, children in Africa · 4 vaccines + nets + fast treatment, Uzbekistan = proof · "Block the bite, test early, treat fast"
15	Thank you for your attention → questions → click to References

Memory hooks

P-A-L-R = "polar"
Parasite → Anopheles (female, at night) → Liver → Red blood cells. Say "polar" and unpack it.

Two weeks, one day
10–15 days until symptoms (≈ two weeks). 24 hours from mild to deadly (one day). Big number first, small number second.

Almost all vs one in ten
Untreated severe malaria: almost everyone dies (≈100%). Treated: 10–20% still die. That is why the key word is TIME.

Your slides ask questions
"What is malaria?" → "How deadly is it?" → "How long has it been with us?" Your handover is also a question.

Conclusion = your team
Idea 1 is your part, idea 2 is Muhammadrizo, idea 3 is Ramazan, idea 4 is Akmalbek. Look at each of them as you say it.

Self-test · cover the right column, answer aloud

Virus, bacterium or parasite?	**Parasite: Plasmodium**
Which mosquito, and when?	**Female Anopheles, mostly at night**
Where does the parasite go first?	**The liver, then red blood cells**
How many species infect humans?	**5 · deadliest: falciparum**
Days until symptoms?	**10–15 days**
How fast can it kill?	**Within 24 hours**
Severe malaria deaths: untreated / treated?	**≈100% / 10–20%**
Our motto?	**Block the bite, test early, treat fast**

MUHAMMADRIZO ASATULLAYEV

History and outbreaks · your slides 01, 05, 06, 07 · target ≈ 3:21 (must stay between 3:00 and 3:30) · highlighted = handover lines · **bold** = numbers to own

---

01 Malaria 0:22 – 0:30 · right after the person before you

Good afternoon. My name is Asatullayev Muhammadrizo Anvarjon o'g'li, and my ID number is b2603096.

---

05 First records 2:48 – 3:57 · click → slide 5

Thank you, Javohir. As Javohir said, malaria is a very old enemy. In fact, it is one of the oldest diseases known to humanity.

The first records come from China. A Chinese medical text from about **2700 BC** describes fevers that return again and again, together with an enlarged spleen. These are the classic signs of malaria.

In Egypt, medical papyri from **1570 BC** describe similar fevers. And modern science found real proof: in **2010**, researchers found the DNA of the malaria parasite in the mummy of the pharaoh Tutankhamun. So even a king could not escape it.

In ancient Greece, Hippocrates noticed that people who lived near marshes often suffered from these fevers. And the name itself is Italian: mal aria means bad air, because people believed that the disease came from the air of the swamps.

---

06 The great discoveries 3:57 – 5:01 · click → slide 6

For thousands of years, nobody knew the real cause. The answer came only at the end of the nineteenth century.

In **1880**, a French army doctor in Algeria, Alphonse Laveran, looked through his microscope at the blood of a sick soldier and saw the parasite. Later he received the Nobel Prize for this work.

On the twentieth of August **1897**, the British doctor Ronald Ross, working in India, found the parasite inside a mosquito. He called this day Mosquito Day, and in **1902** he received the Nobel Prize. A year later, in **1898**, the Italian scientist Giovanni Grassi and his team proved that human malaria is carried by Anopheles mosquitoes.

Now, for the first time, people knew exactly who the enemy was: a parasite, and its carrier, the mosquito.

---

07 Major outbreaks 5:01 – 6:02 · click → slide 7

Once people knew the enemy, they could fight it. But malaria still caused terrible epidemics.

In **1934** and **1935**, in Sri Lanka, which was then called Ceylon, a drought created perfect breeding places for mosquitoes. About one and a half million people fell ill, and about **eighty thousand** died.

In **1958**, Ethiopia suffered one of the worst epidemics in history: about **three million** cases and **one hundred and fifty thousand** deaths.

And this is not only history. After the terrible floods of **2022** in Pakistan, malaria cases grew at least four times. And in **2024**, Ethiopia, Madagascar and Yemen together added about **five million** new cases in just one year.

So what does malaria cost the world today? Ramazan will show you the numbers.

Laveran	la-VRAHN
Algeria	al-JEER-ee-ə
Ceylon	si-LON
epidemic	e-pi-DE-mik

Capital letters = stressed syllable.

Memory hooks

The disease travels west
China → Egypt → Greece → Italy, like a journey along an old trade road. Each stop has one clue: spleen · pharaoh · marshes · bad air.

27 → 15 → 4
2700 BC, 1570 BC, 400 BC: the hundreds go down 27, 15, 4.

Saw it · caught it · named it
1880 Laveran SAW the parasite in blood. 1897 Ross CAUGHT it in a mosquito. 1898 Grassi NAMED the mosquito: Anopheles.

The Nobel paradox
Laveran was first (1880) but got his Nobel later (1907). Ross was second (1897) but got his Nobel first (1902).

Dry and wet both kill
Ceylon 1934–35: DROUGHT (80,000 deaths). Pakistan 2022: FLOODS (×4 cases). Water in pools = mosquito babies.

Then ×4, now +5
Pakistan: cases ×4. 2024: +5 million cases in Ethiopia, Madagascar, Yemen. Four, then five.

✂ cut out · the only notes you take on stage

01	Good afternoon · full name · ID
05	Thank you, Javohir · China 2700 BC: fevers + spleen · Egypt 1570 BC papyri · 2010: DNA in Tutankhamun · Greece: Hippocrates, marshes · Italy: mal aria = bad air
06	Cause unknown until end of 1800s · 1880 Laveran, Algeria, microscope → Nobel · 20 Aug 1897 Ross, India, Mosquito Day → Nobel 1902 · 1898 Grassi: Anopheles · enemy = parasite + carrier = mosquito
07	Ceylon 1934–35: drought · 1.5 M ill · 80,000 dead · Ethiopia 1958: 3 M · 150,000 · Pakistan 2022 floods: ×4 · 2024 Ethiopia + Madagascar + Yemen: +5 M → pass to Ramazan

Self-test · cover the right column, answer aloud

Oldest record?	China, c. 2700 BC: fevers + enlarged spleen
Egypt?	Papyri 1570 BC; 2010: DNA in Tutankhamun
Who linked fevers to marshes?	Hippocrates, ancient Greece
What does mal aria mean?	Bad air (Italian)
1880?	Laveran sees the parasite, Algeria · Nobel 1907
20 August 1897?	Ross finds it in a mosquito, India · Nobel 1902
1898?	Grassi: Anopheles carries human malaria
Ceylon / Ethiopia?	1934–35: 1.5 M ill, 80,000 dead · 1958: 3 M cases, 150,000 dead
2022 / 2024?	Pakistan floods ×4 · +5 M (Ethiopia, Madagascar, Yemen)

RAMAZAN BAKIYEV

Malaria today · your slides 01, 08, 09, 10 · target ≈ 3:19 (must stay between 3:00 and 3:30) · highlighted = handover lines · **bold** = numbers to own

---

01 Malaria 0:30 – 0:37 · right after the person before you

Good afternoon. My name is Bakiyev Ramazan Sherzodovich, and my ID number is b2605509.

---

08 Malaria today 6:02 – 7:12 · click → slide 8

Thank you, Muhammadrizo. As Muhammadrizo showed, malaria is not only a disease of the past. Let me show you the latest numbers from the World Malaria Report, published by WHO in December **2025**.

In **2024**, there were about **two hundred and eighty-two million** cases of malaria in **eighty** countries. **Six hundred and ten thousand** people died. That is almost **one thousand seven hundred** people every single day.

The burden is very unequal. Africa carries **ninety-four percent** of all cases and **ninety-five percent** of all deaths. Just five countries, Nigeria, the Democratic Republic of the Congo, Uganda, Ethiopia and Mozambique, have more than half of all cases in the world.

And the most painful number: in Africa, three out of four people who die from malaria are children under five years old. That is more than **one thousand** small children every day.

---

09 The numbers are rising 7:12 – 8:10 · click → slide 9

And here is the worrying part: the number of cases is going up. In **2015**, there were **two hundred and thirty million** cases. In **2023**, **two hundred and seventy-three million**. And in **2024**, **two hundred and eighty-two million**. Deaths also grew, from **five hundred and seventy-eight thousand** to **six hundred and ten thousand**. The death rate per person is lower than **ten** years ago, but the population keeps growing.

One big reason is money. The global strategy needs about **nine point three billion** dollars a year. In **2024**, the world invested only **three point nine billion** dollars. That is just **forty-two percent** of what is needed. And without money, there are fewer nets, fewer tests and fewer medicines.

---

10 Malaria can be defeated 8:10 – 9:14 · click → slide 10

But there is also good news. Since the year **2000**, malaria control has prevented **two point three billion** cases and **fourteen million** deaths. Today, **forty-seven** countries and one territory are officially certified as malaria-free.

And one of them is our own country. Uzbekistan first stopped malaria in **1961**, but the disease came back. In **2005**, the countries of our region signed the Tashkent Declaration and promised to eliminate malaria. In Surkhandarya, the most affected province, cases fell from **eighty-one** in **2007** to zero. The last local cases were found in **2010**, and in December **2018**, WHO officially certified Uzbekistan as malaria-free. According to WHO, the key was early diagnosis and treatment, free of charge for everyone.

So malaria can be defeated. But with which tools? Akmalbek will explain.

YOUR MEMORY PAGE

3 words per slide

01	Malaria	Greeting · topic · 4 names + IDs
08	Malaria today	282 M · 610k · Africa 94/95% · 3 of 4

AKMALBEK ABDURAIMOV

Vaccine, prevention and treatment · your slides 01, 11, 12, 13 · target ≈ 3:18 (must stay between 3:00 and 3:30) · highlighted = handover lines · **bold** = numbers to own

---

01 Malaria 0:37 – 0:45 · right after the person before you

Good afternoon. My name is Abduraimov Akmalbek Jamshit o'g'li, and my ID number is b2606469.

---

11 The vaccine 9:14 – 10:24 · click → slide 11

Thank you, Ramazan. As Ramazan said, malaria can be defeated, and today we have a new weapon: a vaccine. For a long time it seemed impossible, because a parasite is much more complex than a virus or a bacterium.

The first vaccine, RTS,S, is the result of **thirty** years of research by the company GSK. In October **2021**, WHO recommended it for children, and called it a historic moment. In October **2023**, WHO recommended a second vaccine, R21, developed by the University of Oxford. In areas where malaria is seasonal, it reduced cases by **seventy-five percent**. And it is affordable: according to WHO, it is cost-effective at only two to four dollars per dose.

In the pilot programme in Ghana, Kenya and Malawi, child deaths from all causes fell by **thirteen percent**. And by October **2025**, **twenty-four** countries were using malaria vaccines.

---

12 Prevention 10:24 – 11:21 · click → slide 12

But a vaccine alone is not enough. Prevention is still our main shield.

The most important tool is very simple: a bed net treated with insecticide. Between **2000** and **2015**, these nets were responsible for **sixty-eight percent** of all malaria cases prevented in Africa. But a net works only if people sleep under it every night.

Second, spraying insecticide on the inside walls of houses, where mosquitoes rest after they bite.

Third, preventive medicines for children during the rainy season. In **2024**, about **fifty-four million** African children received them in each round.

And finally, personal protection: repellents, long sleeves, and no standing water near the house. Travellers to risk areas should also take preventive tablets.

---

13 Treatment 11:21 – 12:24 · click → slide 13

And if a person is already sick? Malaria is curable, but the first step is always a test: a blood test under the microscope, or a rapid test.

The history of treatment is fascinating. In the **1600s**, people used the bark of the South American cinchona tree against fever, and in **1820** scientists extracted quinine from it. In the **1970s**, the Chinese scientist Tu Youyou found artemisinin in an ancient herbal medicine, sweet wormwood. In **2015**, she received the Nobel Prize.

Today, the most effective treatment is artemisinin-based combination therapy, or ACT. For severe malaria, doctors give artesunate by injection. But there is a new danger: in Eritrea, Rwanda, Uganda and Tanzania, the parasite is becoming partially resistant to artemisinin.

Now Javohir will sum up our presentation.

YOUR MEMORY PAGE

3 words per slide

01	Malaria	Greeting · topic · 4 names + IDs
11	The vaccine	RTS,S 2021 · R21 2023 · −13% · 24
12	Prevention	Nets 68% · spray · medicines 54 M · personal
13	Treatment	Test · bark → quinine → artemisinin · ACT

Say it right

vaccine	VAK-seen
insecticide	in-SEK-ti-syd
repellent	ri-PE-lənt
cinchona	sing-KOH-nə
quinine	KWY-nyn
artemisinin	ar-tə-MIS-i-nin
artesunate	ar-TE-sə-nayt
Tu Youyou	too yoh-YOH

Capital letters = stressed syllable.

✂ cut out · the only notes you take on stage

01 Good afternoon · full name · ID

11 Thank you, Ramazan · new weapon · parasite > virus (complex) · RTS,S: 30 years, GSK, WHO Oct 2021 "historic" · R21: Oxford, Oct 2023, −75% seasonal, $2–4 per dose · pilot Ghana, Kenya, Malawi: −13% child deaths · 24 countries (Oct 2025)

12 Main shield · 1 Nets: 68% of prevented cases (2000–2015), every night · 2 Spray walls · 3 Medicines for children, rainy season: 54 M · 4 Personal: repellent, sleeves, no standing water, travellers' tablets

13 Curable · test first: microscope or rapid test · 1600s cinchona bark → 1820 quinine · 1970s Tu Youyou, sweet wormwood → artemisinin → Nobel 2015 · today ACT · severe: artesunate injection · resistance: Eritrea, Rwanda, Uganda, Tanzania → pass to Javohir

Memory hooks

Before, around, after
Vaccine = shield BEFORE. Prevention = shield AROUND you. Treatment = cure AFTER. That is the order of your three slides.

The younger brother
RTS,S is the older brother: 2021, GSK, 30 years of research. R21 is the younger brother: 2023, Oxford, −75%, $2–4 a dose.

Good Kids Matter
G-K-M = Ghana, Kenya, Malawi: the pilot countries, −13% child deaths. By October 2025: 24 countries.

Nets Stop Malaria, Period
N-S-M-P = Nets (68%), Spray, Medicines for children (54 million), Personal protection.

Tree → pill → plant → combo
1600s cinchona bark → 1820 quinine → 1970s artemisinin from sweet wormwood (Tu Youyou, Nobel 2015) → today ACT.

It's TRUE, read backwards
Resistance countries in your order: Eritrea, Rwanda, Uganda, Tanzania = E-R-U-T = TRUE backwards.

Self-test · cover the right column, answer aloud

First vaccine?	RTS,S · GSK · 30 years · WHO Oct 2021
Second vaccine?	R21 · Oxford · WHO Oct 2023 · −75% seasonal · $2–4
Pilot result?	−13% child deaths (Ghana, Kenya, Malawi)
Countries using vaccines?	24 by October 2025
Nets' share of prevented cases?	68% (Africa, 2000–2015)
Children on seasonal medicines?	≈54 million per round (2024)
Quinine?	From cinchona bark; extracted 1820
Artemisinin?	Tu Youyou, sweet wormwood, 1970s · Nobel 2015
Resistance countries?	Eritrea, Rwanda, Uganda, Tanzania

FOUR DAYS TO LEARN IT

Short sessions on different days beat one long night: each day you recall the talk again, and every recall makes it stronger. 20 – 30 minutes a day is enough.

Day 1 · Understand	Listen to **00_Full_run-through** once to hear the whole story and the handovers. Then play **your "my part"** 3 times while reading your script page. Mark where you breathe.
Day 2 · Shadow	Play **your shadowing track** twice: repeat each phrase aloud in the pause. Then say your part from the **3 words per slide** list only.
Day 3 · Own it	Speak from the cue card with a timer and record yourself on the phone. Do the **self-test** on your memory page. Fix every number you missed using the hooks.
Day 4 · Together	Two full group run-throughs with the slides and a clicker, standing. Practise the four handovers until they are smooth. Total time 12 – 15 minutes.
Exam morning	One listen to your "my part" with headphones (3 minutes). One run-through of the handovers only. Breathe.

Your audio files (output/audio)

File	What it is · how to use it
00_Full_run-through_all_speakers.mp3	The whole talk in four voices, a soft click = next slide. Listen once on Day 1 and once on Day 4.
0N_Name_1_my_part.mp3	Only your part (≈ 3 min). Before each entry you hear the previous speaker's last line: that is your cue to start.
0N_Name_2_shadowing.mp3	Your part phrase by phrase. After each phrase there is a pause of the same length: repeat it aloud.

Memory palace (5 minutes, works very well)

Walk through your home in your mind and put one slide in each place: door, corridor, kitchen, window, sofa. Picture the image of the slide there (a mosquito on the door, an hourglass in the kitchen…). On stage, "walk" to the next room and the next slide comes back.

On stage

- Look at the teacher **and** the audience; move your eyes every sentence or two.
- Stand still, open hands, no hands in pockets.
- Pause after every number: let it land.
- One click = next slide. Wait one second for the animation, then speak.
- When others speak, look at them or at the screen, not at your notes.

Do not

- Read from the slides or from a sheet.
- Use fillers: "eee", "um", "like", "actually".
- Hold your phone or chew gum.
- Apologise or say "I forgot".

Bring

- ID card, formal clothes, one small cue card.
- The .pptx on a USB stick and in Telegram.

If you forget a line: look at the slide title, say its 3 keywords in one simple sentence and continue with the next point. The audience does not know your script.

POSSIBLE QUESTIONS

The owner answers first; the others may add one sentence. Keep answers to two or three sentences. If you do not know: “That is a good question. From our sources we know..., but we did not study this part in detail.”

Javohir Azamov

Is malaria caused by a virus or by bacteria?

Neither. It is caused by a single-celled parasite called Plasmodium. That is also why a vaccine was so difficult to make (WHO, 2025a).

Javohir Azamov

Why does only the female mosquito spread malaria?

Only female Anopheles mosquitoes bite people: they need blood to produce their eggs. Males feed on plant juices.

Javohir Azamov

Can I get malaria from another person?

Not like a cold. It needs a mosquito. In rare cases it can pass through blood, for example a transfusion, or from a mother to her baby.

Muhammadrizo Asatullayev

Why is the disease called malaria?

From the Italian mal aria, "bad air". People thought the air of the swamps caused it. Today we know it is the mosquito that lives near the swamps (Cox, 2010).

Muhammadrizo Asatullayev

Who discovered the parasite?

Alphonse Laveran, a French army doctor, in Algeria in 1880. Ronald Ross then showed the mosquito link in 1897, and Grassi's team proved it was Anopheles in 1898.

Muhammadrizo Asatullayev

Why did the 1934–35 epidemic in Ceylon start?

A drought dried the rivers into small pools: perfect places for mosquito larvae. About 80,000 people died (Gill, 1935).

Ramazan Bakiyev

Why is Africa hit hardest?

It has the most dangerous parasite, P. falciparum, very efficient mosquitoes, a warm climate, and many people far from clinics. That is why it has 94% of cases (WHO, 2025b).

Ramazan Bakiyev

Is there malaria in Uzbekistan today?

No local transmission: the last local cases were in 2010 and WHO certified us malaria-free in 2018. Travellers can still bring cases from abroad, so testing continues (WHO, 2018).

Ramazan Bakiyev

If we have the tools, why are cases rising?

The population grows, funding is only 42% of what is needed, and there is drug resistance, floods and conflict, for example in Ethiopia and Yemen (WHO, 2025b).

Akmalbek Abduraimov

How effective is the vaccine?

R21 reduced cases by 75% in seasonal areas in the first year, and in the pilot child deaths fell by 13%. It is not 100%, so nets are still needed (WHO, 2023b; 2025b).

Akmalbek Abduraimov

What is ACT?

Artemisinin-based combination therapy: artemisinin plus a second medicine. Two medicines together make it harder for the parasite to become resistant (WHO, 2025a).

Akmalbek Abduraimov

What should a traveller do?

See a doctor before the trip, take preventive tablets, use repellent and a net. If fever starts after returning, test immediately and say where you travelled.

EVERY NUMBER AND ITS SOURCE

Figure	Meaning	Source	Who says it
Parasite · 5 species · female Anopheles	cause, species, carrier; not person to person	WHO (2025a)	Javohir
